THE TRICERATOPS

THE TRICERATOPS

The diagram illustrates the structure of the Triceratops' horns, showing a cross-section of the horn base and the internal structure of the horns, which are composed of keratin and bone. The illustration also shows the Triceratops' head with its characteristic frill and horns.

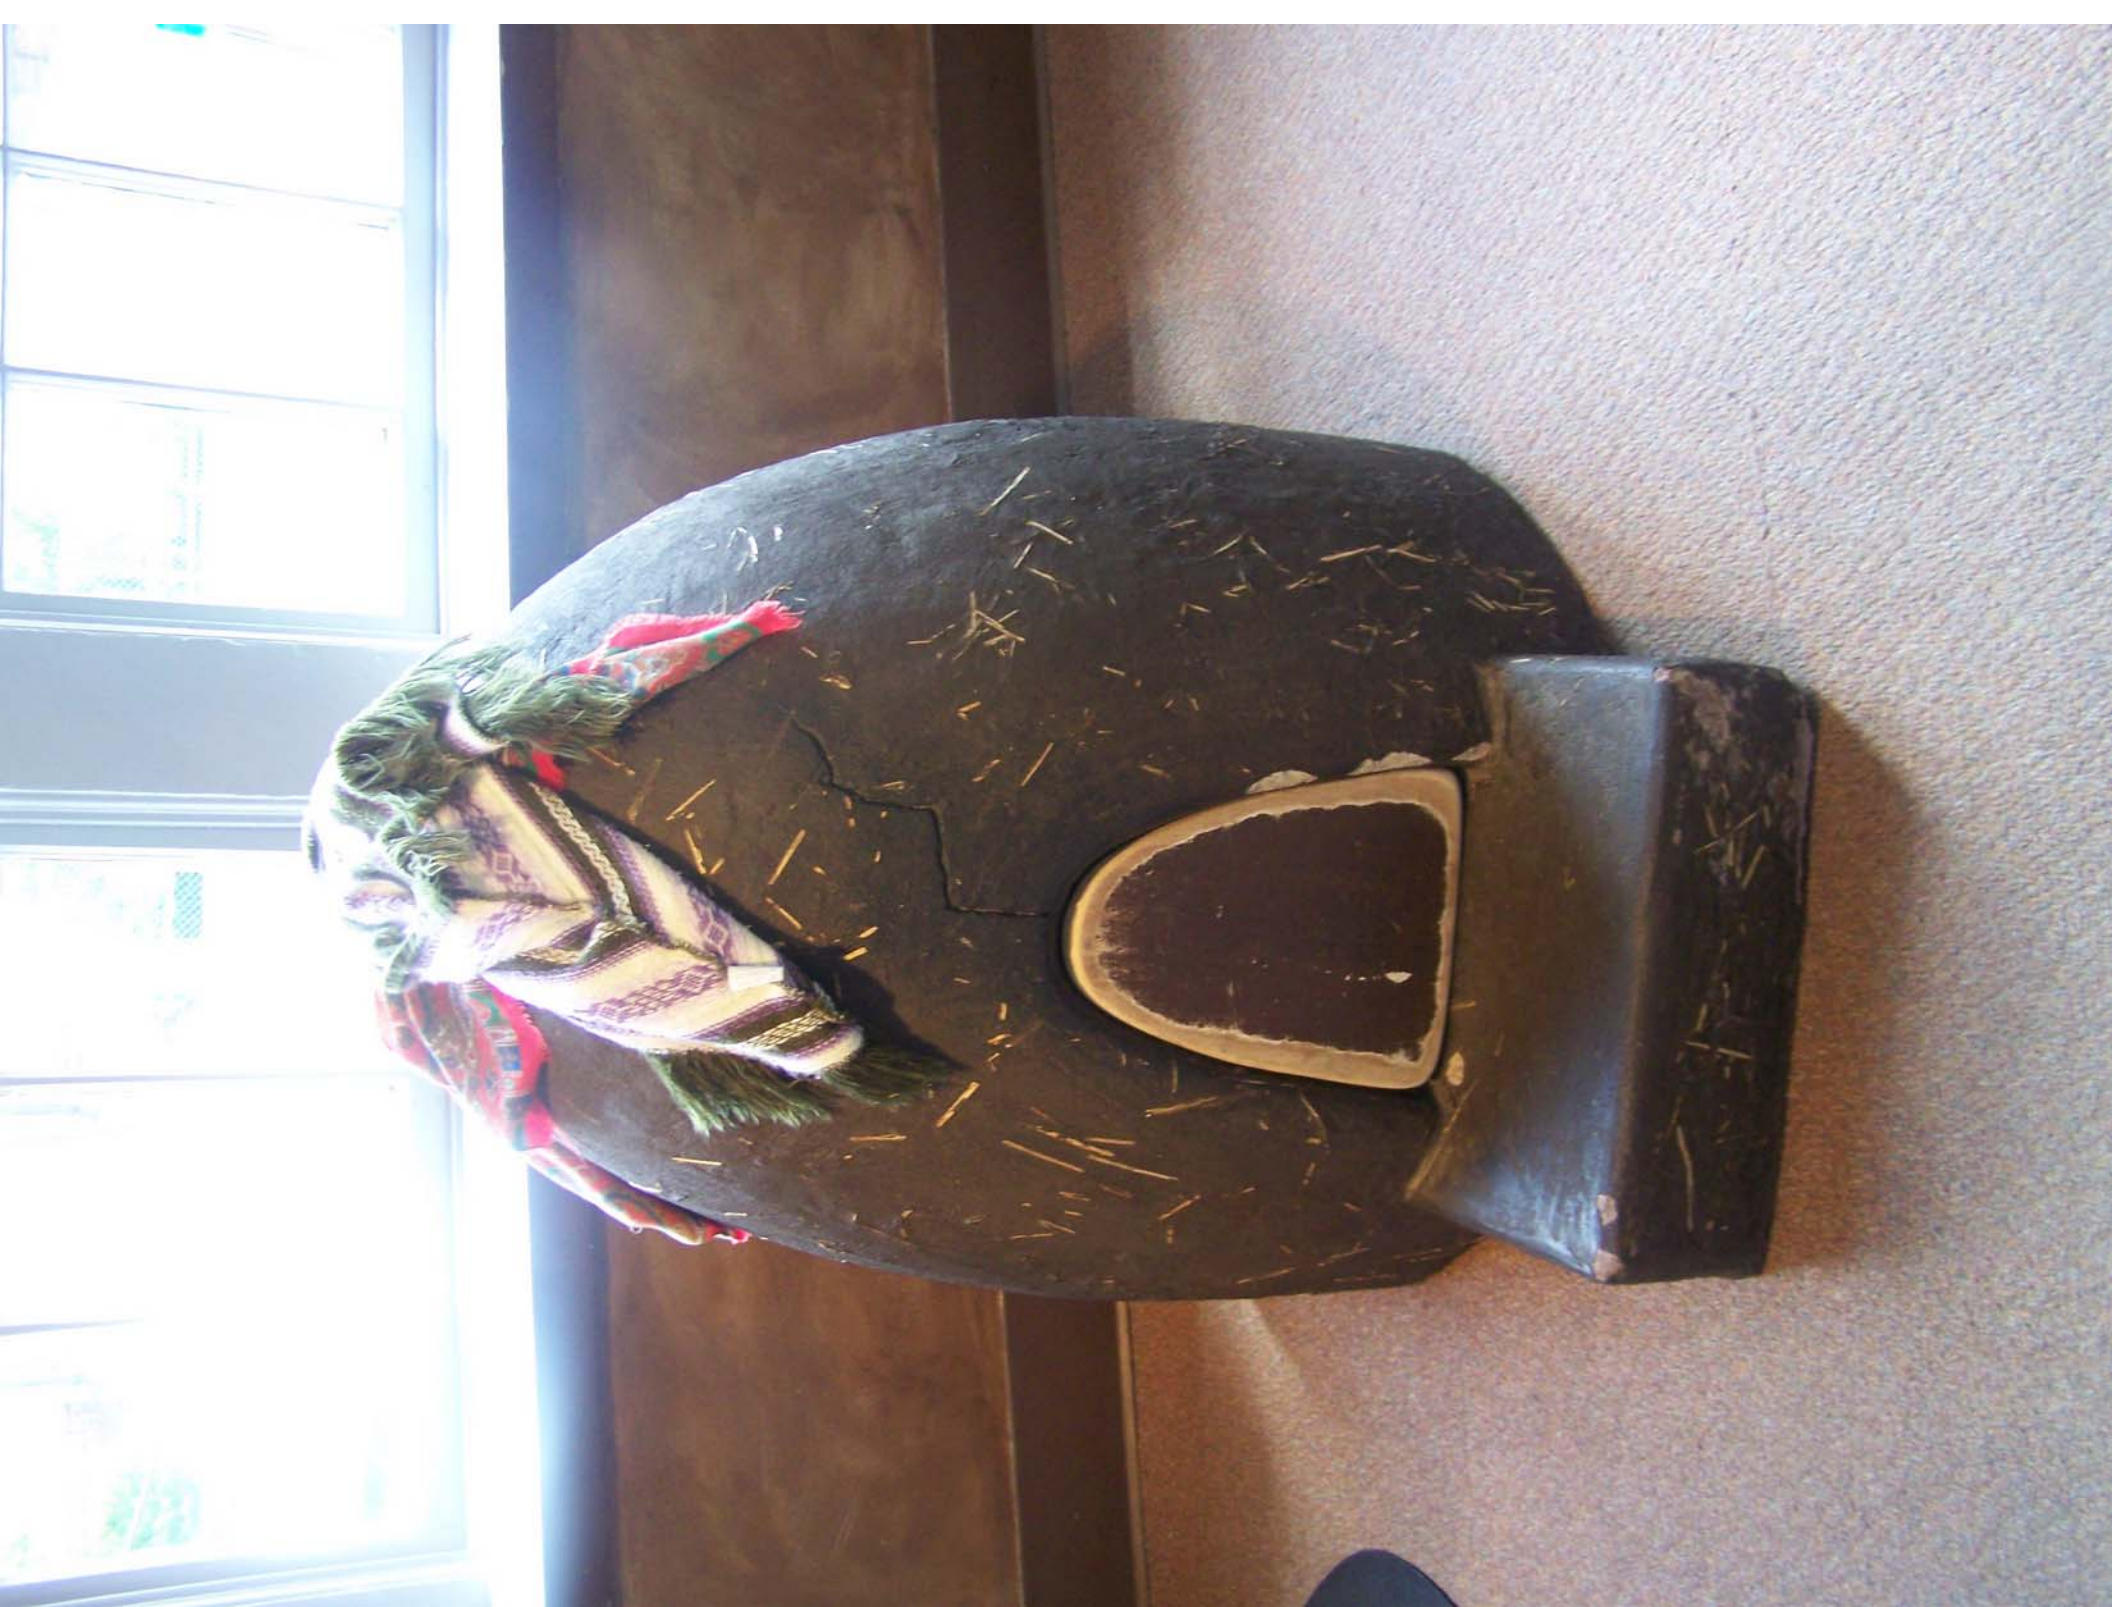

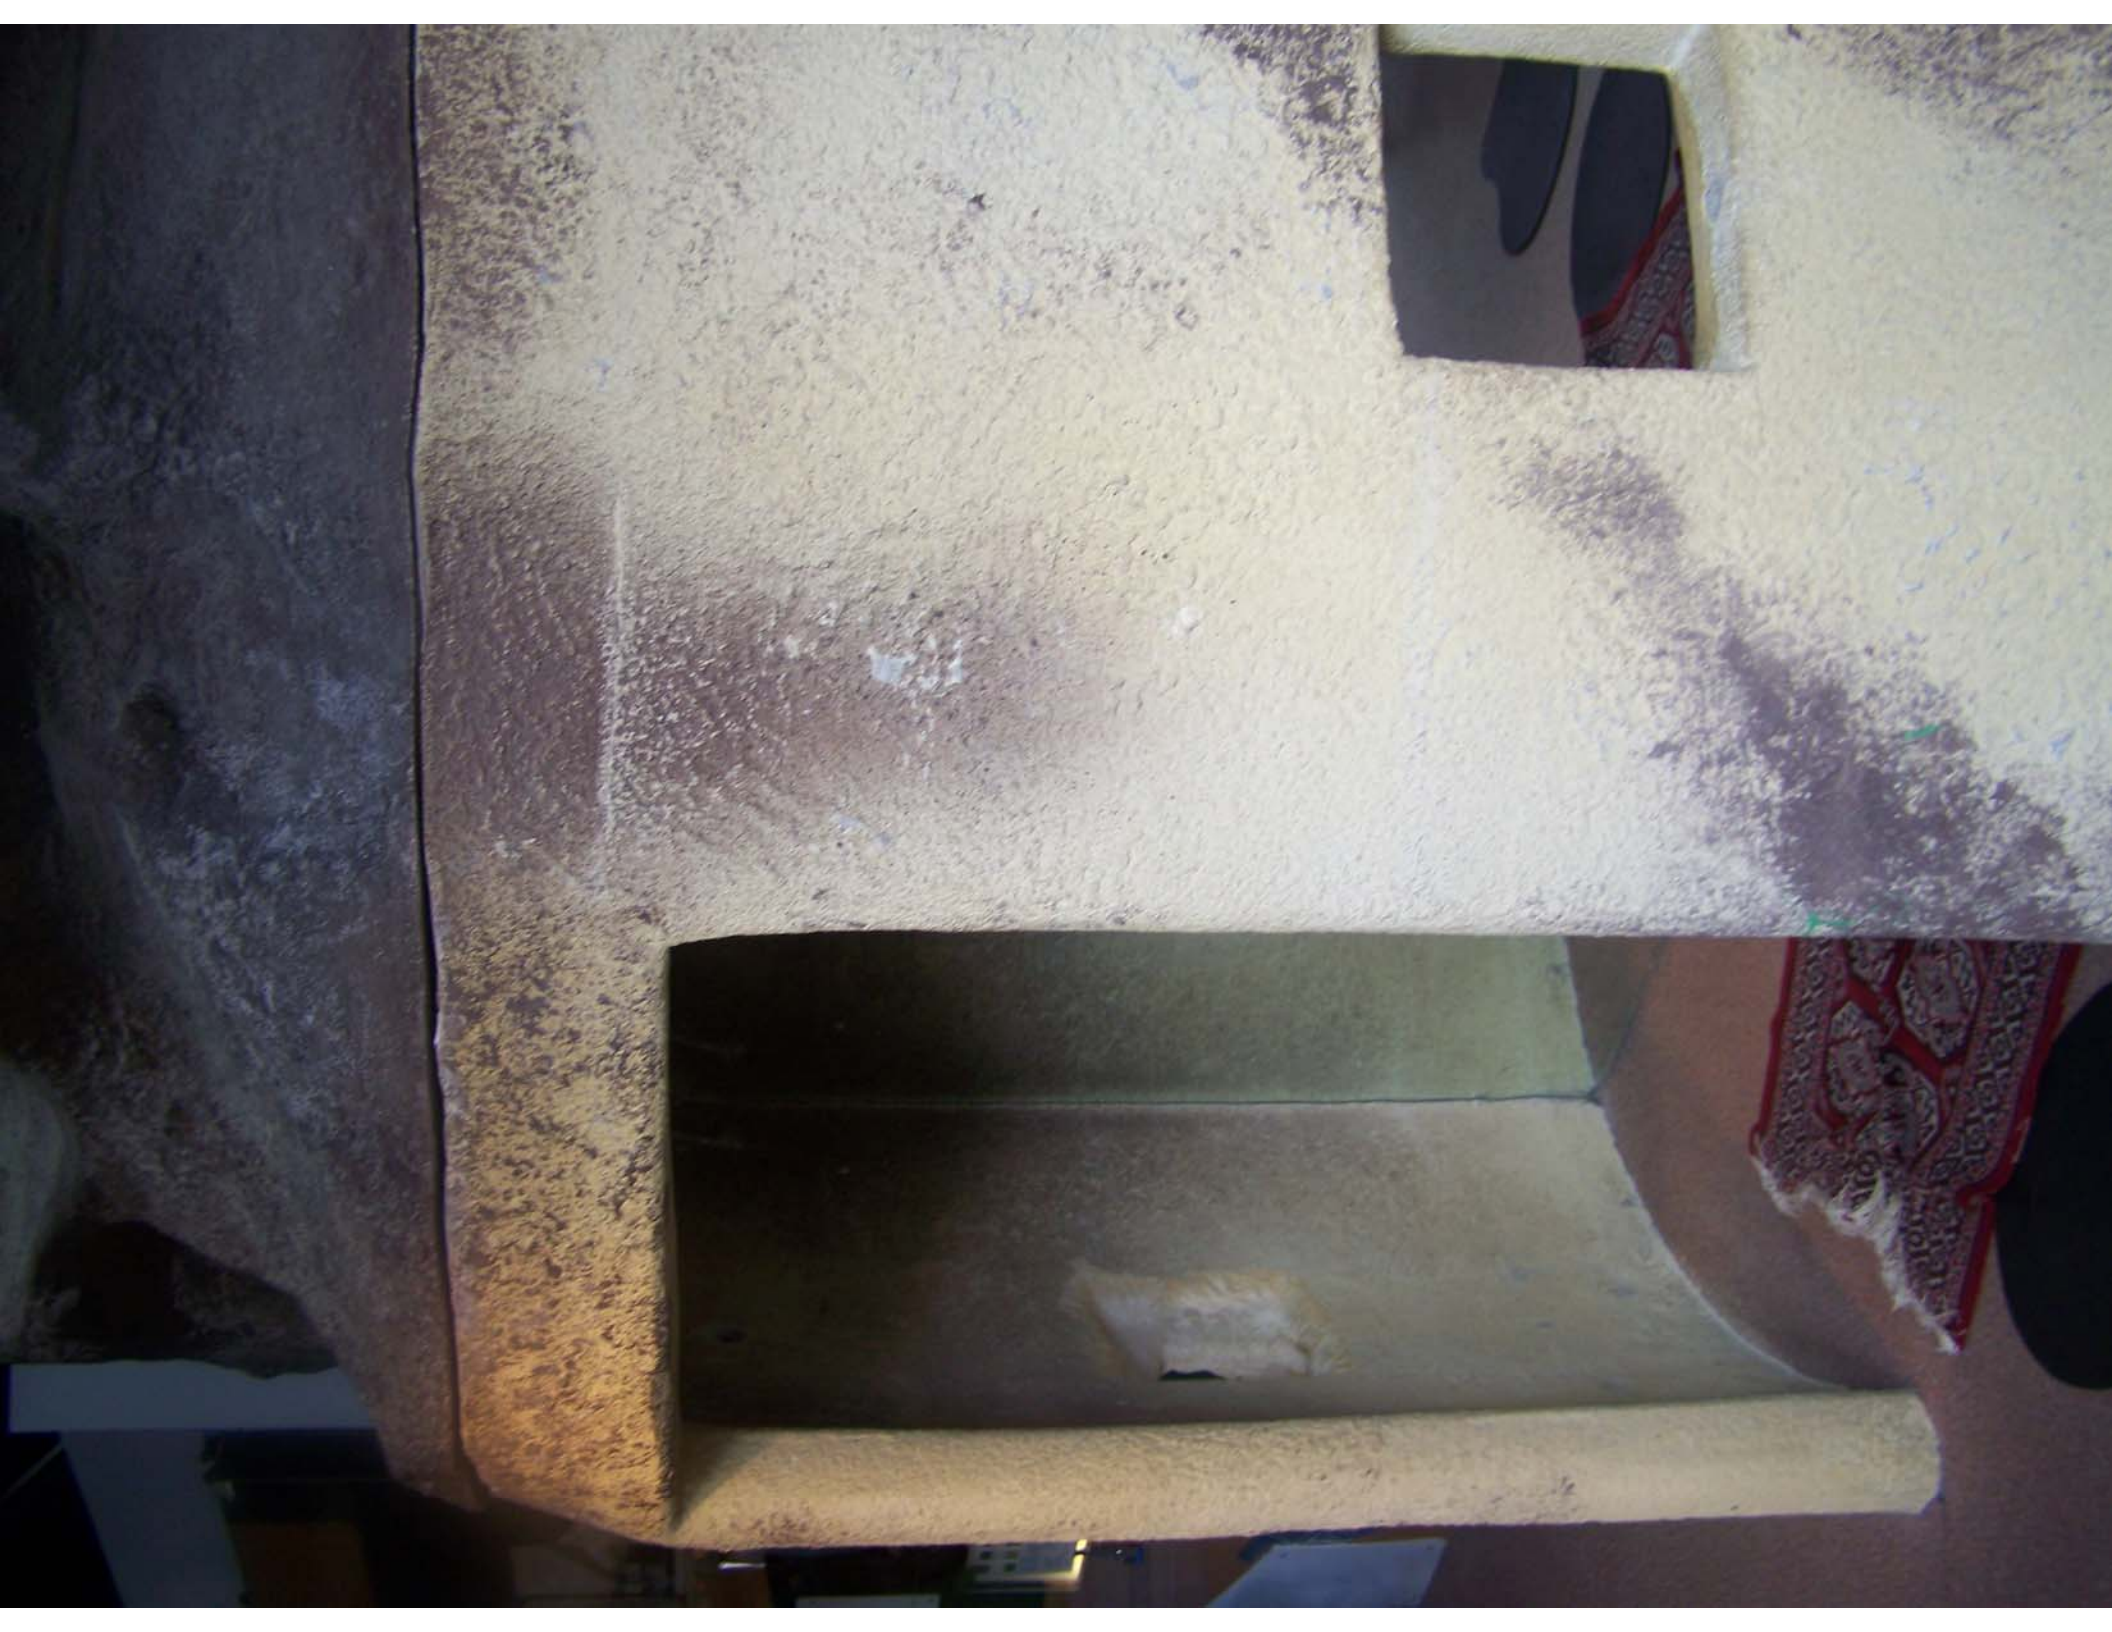

Horno

(Adobe oven)

The Beehive Shaped oven, built with adobe bricks, is common in Hispanic and Pueblo communities in the American Southwest.

Building a horno is considered an art.

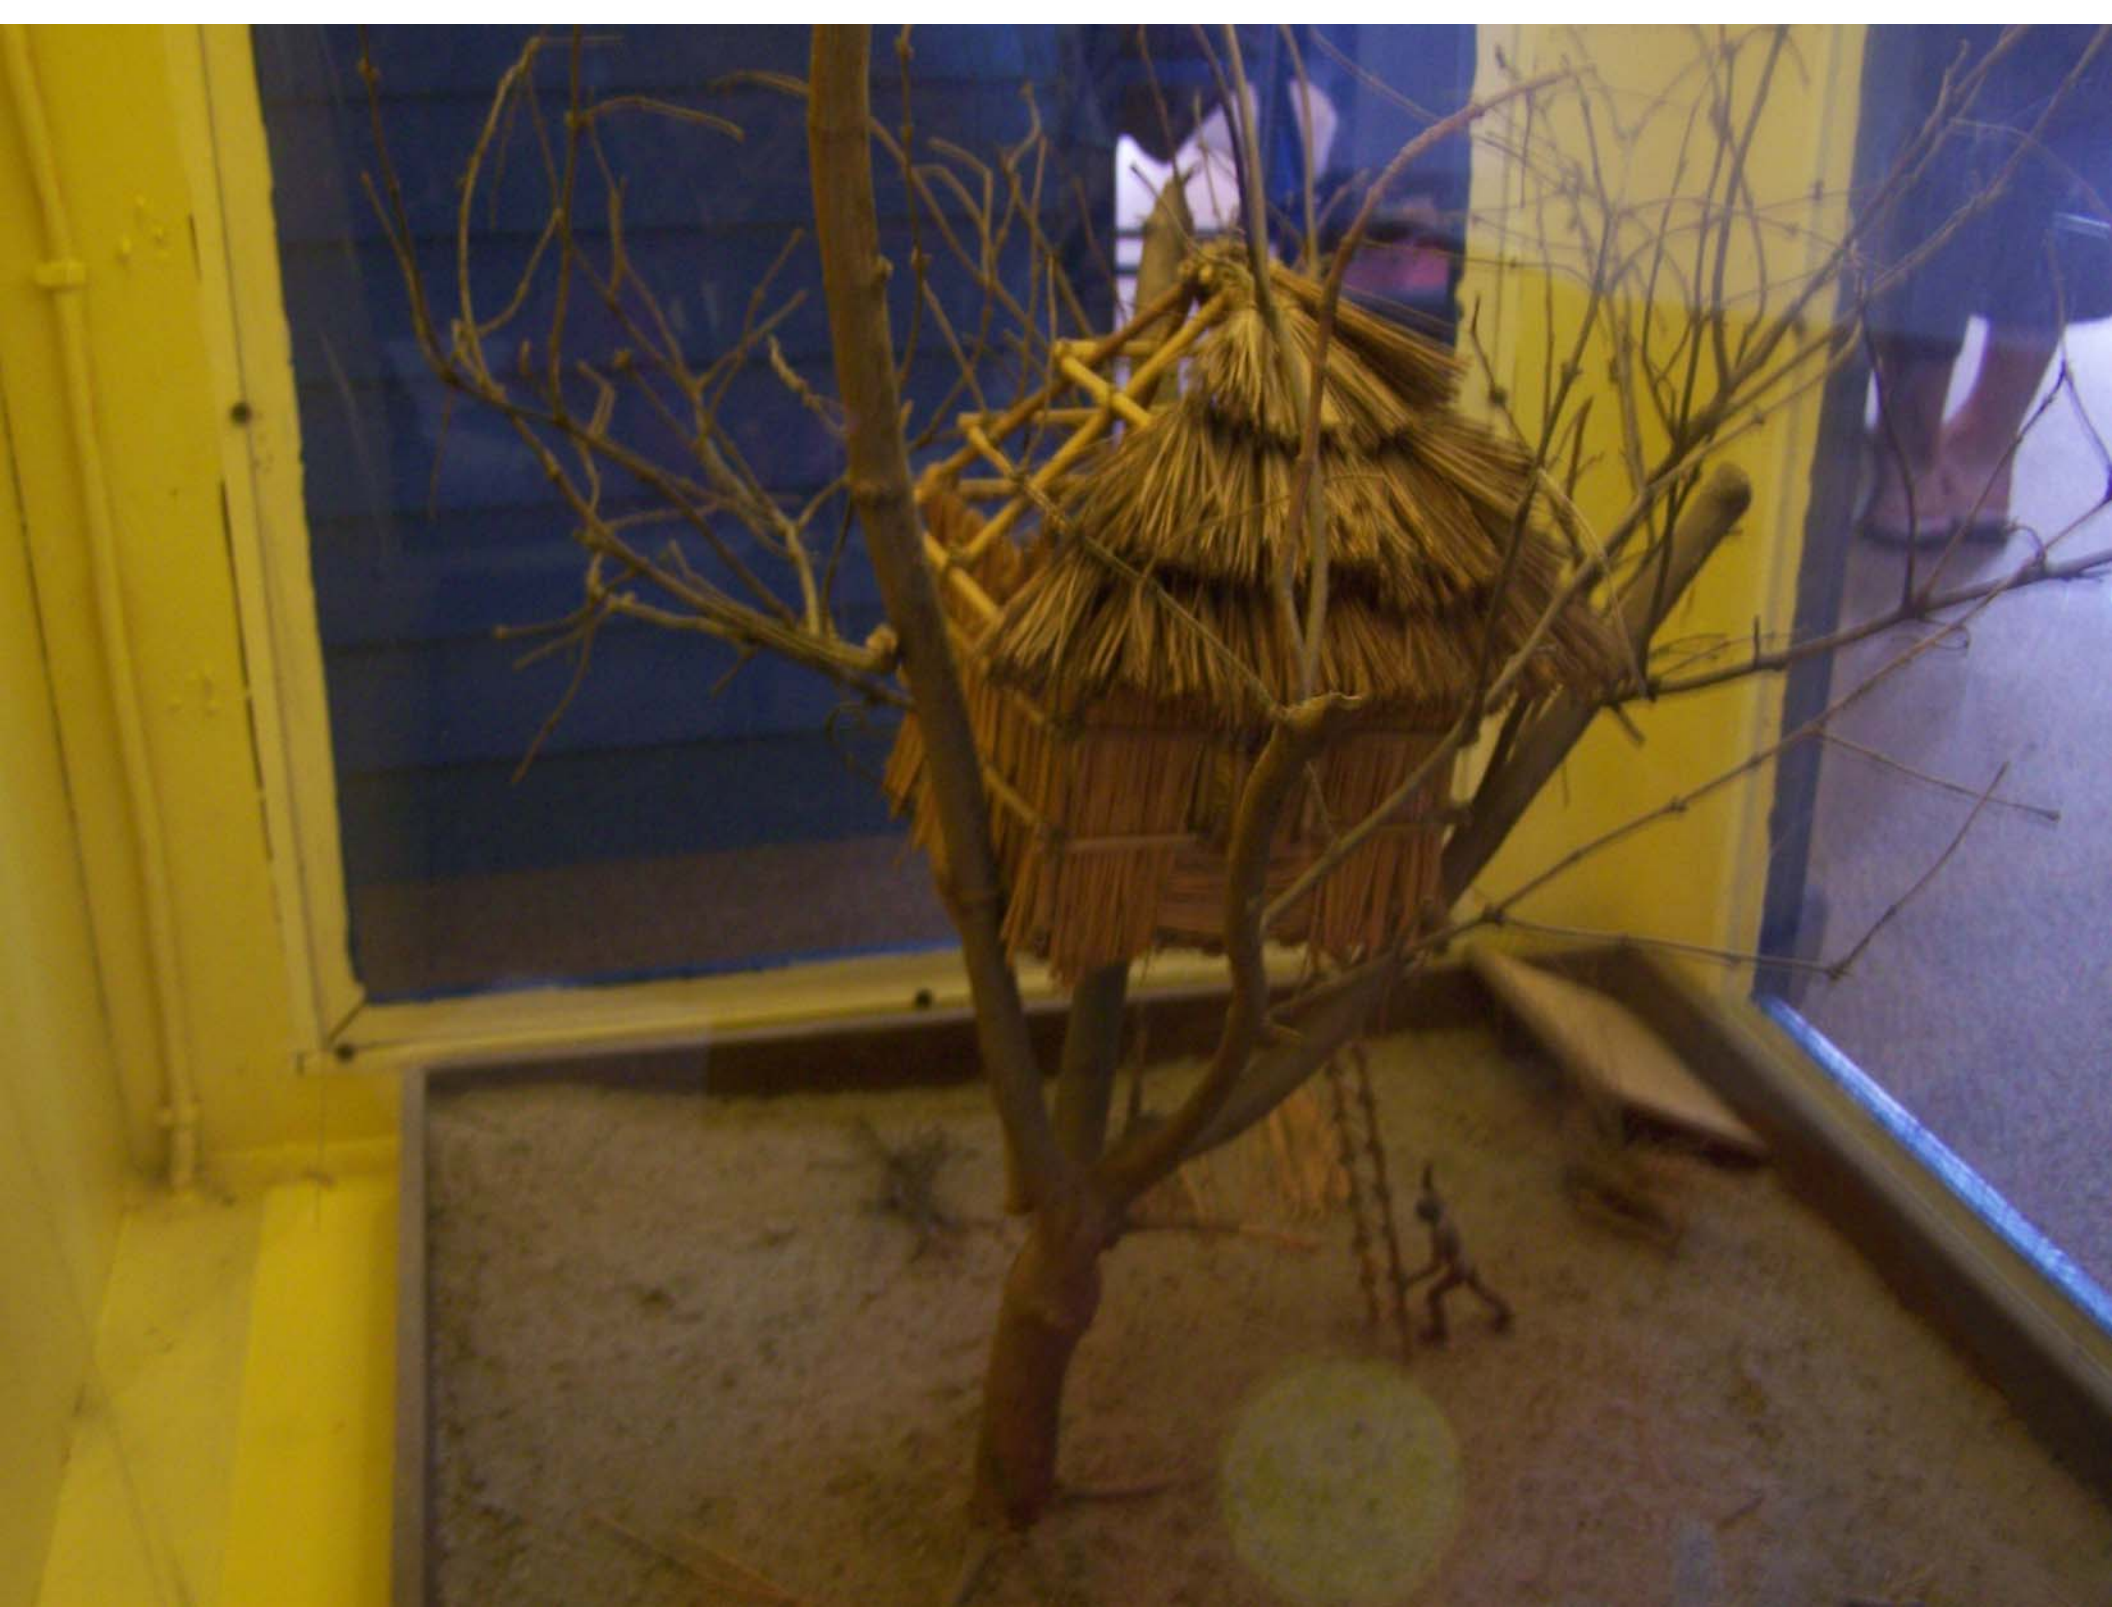

Butterflies are very popular insects, but moths aren't quite as well known. In fact, some of the most destructive pests in the world are moth caterpillars. Do you know how to tell the difference between a moth and a butterfly? It's in the antennae. Butterfly antennae have "kinks" at the end, moth antennae are either straight and thread-like, or feathery.

Are you really into butterflies? You should become a "lepidopterist". A lepidopterist is someone who collects and studies butterflies and moths.
